1 Investment opportunity

SWESTEP has developed a new revolutionary patented process to recycle all organic waste, including plastics, into renewable fuels and sustainable liquids/ oils.

The breakthrough technology offers an economically viable and climate-friendly alternative to reduce the world's fossil dependence. The sustainable solution supports any mix of organic (non-metal, non-soil, non-inert) feedstock, creating new opportunities for recycling and waste management companies, to produce new green raw material and renewable fuels for various business segments in different geographic locations.

Each SWESTEP Plant can process/ recycle biomass, organic waste, incl. plastics, in all forms into sustainable renewable fuel, petrol, diesel, aviation fuel, liquids, new green raw materials for different industries, especially those with high fossil dependence seeking alternative solutions.

The patented cutting-edge Catalytic Pressureless Depolymerization (CPD) process is a stepping-stone to the Circular Economy, supporting the society to close the loop of a material life cycle and in the CO2 Neutral Economy reduce emissions dramatically throughout the entire transport sector.

You can read about this amazing environmentally friendly process at www.SWESTEP.com.

2 About the business

SWESTEP are in discussions with governments and large corporations around the world, of course, all are interested in this new process of dealing with one of our lifetimes greatest threats, pollution!

As in most cases, it comes down to the cost, SWESTEP with its exclusive partnership with Green Fund Finance (GFF) can now offer the new customer an easy no-fuss alternative of financing part or all of the construction of the SWESTEP processing plant.

As each order is agreed, GFF will invest the agreed investment amount from the GFF fund for

the construction of the SWESTEP production plant. Green Fund Finance will become a partner with the owner/ operator.

2.1 What does this all mean?

The government or corporation can order a SWESTEP processing plant at NO cost, they just need to ensure all the necessary permits and legal documentation are in place, including the allocated land and infrastructure to support the ongoing operation after construction. A feasible plan for the supply of feedstock must also be in place.

2.2 You as an investor? You can purchase tokens with the know-

ledge that you are helping the world in becoming healthy again, and of course, you can make a profit on the tokens as well.

2.3 What happens to the invested funds?

GFF will allocate funds to the SWESTEP production project once all criteria have been met, this is based on the requirements from the owner and been agreed between GFF and the owner based on their specifications being part or full production build costs. In return, the fund receives a fixed percentage of the revenue generated by the production plant.

3 Risks involved

3.1 There are presently production plants that are running commercially with SWESTEP technology, none are in the larger production scale that SWESTEP now intends to build. There is, however, nothing that indicates that scaling up the production should create any major obstacles other than fine-tuning the feedstock handling process and running 24/7 operations.

3.2 Due to SWESTEP's technology being on the forefront the permissions and applications are not routine yet. The application process from input to output could in some cases be an unknown time factor. This will however not

be a risk factor that the fund investors will need to take into consideration because the fund will not invest in a project before all permissions are in place.

3.3 New laws that may affect SWESTEP's technology or GFF means of funding in the future. There is nothing that SWESTEP or GFF are aware of that at this time indicates that such laws or regulations are in consideration. On the contrary, several new regulations and laws are in development that will favor the SWESTEP technology.

4 Number of tokens

SWESTEP has customers waiting, and many others in the negotiation and order stages, GFF has the exclusive and unique opportunity to fund the construction of all SWESTEP plant orders and receive up to 50% of the end produced product such as diesel, petrol or aviation fuel.

SWESTEP plants are scalable, It is possible to combine different sizes in terms of production line to meet the capacity required (Size 150, 250, 500, 1000, or 5000 liters/hour) Green Fund Finance created 10 billion (10,000,000,000) tokens – initially valued at €1 per token. The GFF Token System is set up on the Blockchain to ensure

full transparency and investment security. However, not all tokens are released at once. Eg. for this first Swestep plant 43,000,000 tokens have been made available for purchase at €1.00 per token. When a plant is 70-80% funded we release tokens corresponding to the construction cost of the next signed Swestep plant.

When new tokens are released in phase 2 (or 3, or 4 etc.) they can not be sold for €1 as this will devalue the existing tokens already sold (as their market value might have increased). Therefore, when GFF releases new tokens to be sold to finance a new Swestep plant they will be released at the

current token value of the day when the sale is initiated.

4.1 The advantage to you as an investor? All GFF financed production plants will be using the same token with different volumes of produce coming from different plants, this will reduce the risk for investors since their investment will not be dependent on a single production unit and it will ensure a more stable growth across all investments and token value. There will be a larger number of investors involved in the trading of our token, thereby creating a more liquid marketplace and increasing the availability of tokens for the purpose of buy-

back without creating huge daily fluctuations in the token value.

PWC will closely monitor that GFF follows the rules set and thereby becoming the investors best impartial monitor for this.

The SWESTEP production Plant construction will be calculated and valued at a Euro value, this will depend on the size of the input and output from the plant and geographical location. GFF will agree with the owner/operator the running costs before GFF invests, this amount will be deducted monthly from the revenues produced by the plant before the GFF / owner/operator

partner split.

5 An example of financing

The estimated construction costs for a larger SWESTEP production plant is €10 million.

Once 10% of financing is secured those funds will go to SWESTEP to start construction as per agreement.

The estimated construction time is 18 months. Token holders will have access to data and construction updates from the account page. Once the production starts, 50% of the daily production will be available to the site owners. The remaining 50% will be available to GFF. Once the end-product (e.g. diesel) is sold, GFF's profits will be used to buy

back the original tokens from the exchange – at current exchange rate – whatever that will be, but never less than €1.20 per token, thus increasing the demand of the token which increases the market value of the token. Approximately 95% of the purchased tokens will be destroyed, thus lowering the total number of tokens in circulation and naturally increasing the value of the remaining tokens. This token purchase by GFF will be on a monthly basis.

The above process is crafted to ensure that the overall token value will increase over time, increasing the value of the remaining tokens in circulation.

5.1 What Now? To be part of this project you will need to contact your Green Fund Finance representatives to discuss your participation level. The investment is made by Ethereum, Bitcoin or Euro.
